

CERTIFICATE OF ANALYSIS – TECHNICAL DATA SHEET

Product name	Alpha-1 antitrypsin, Human, clone 3C11		
Catalog number	HM2358		
Lot number	-	Expiry date	-
Volume	1 ml	Amount	100 µg
Formulation	0.2 µm filtered in PBS+0.1%BSA+0.02%NaN3	Concentration	100 µg/ml
Host Species	Mouse IgG2a	Conjugate	None
Endotoxin	N.A.	Purification	Protein G
Storage	4°C		

Application notes

	IHC-F	IHC-P	IF	FC	FS	IA	IP	W
Reference #						1		1,2
Yes						•		•
No								
N.D.	•	•	•	•	•		•	

N.D.= Not Determined; IHC = Immuno histochemistry; F = Frozen sections; P = Paraffin sections; IF = Immuno Fluorescence; FC = Flow Cytometry; FS = Functional Studies; IA = Immuno Assays; IP = Immuno Precipitation; W = Western blot

W: reduced western blot with monomeric alpha-1 antitrypsin (0.5 µg) shows a band of ~60 kDa when HM2358 is used. The concentration of HM2358 was 2 µg/ml.

Dilutions to be used depend on detection system applied. It is recommended that users test the reagent and determine their own optimal dilutions. The typical starting working dilution is 1:50.

- IA: When used as a detection antibody in sandwich ELISA, the antibody 3C11 reacts with similar affinity with monomeric and polymeric alpha-1 antitrypsin (Ref.1).
- W: Non-denaturing (3–12% NativePAGE Bis–Trisgel) and SDS-PAGE gels were used to separate the samples. 6 M urea gel was prepared with 8% acrylamide (w/v) and 0.375 M Tris buffer (Ref.2). Both reduced and non-reduced sample treatment can be used.

General Information
Description

Antibody clone 3C11 recognizes both the healthy monomeric form (M variant) and the disease associated polymeric forms (Z variants) of human alpha-1-antitrypsin with equal affinity. Alpha-1-antitrypsin is a member of the serine protease inhibitor (serpin) superfamily which are proteins known for their ability to inhibit proteases. It is the most abundant circulating protease inhibitor known. It mainly targets enzymes released by neutrophils, especially neutrophil elastase (NE) but also proteinase 3 (PR3) and Cathepsin G (CG). Serpinopathies are conformational diseases characterized by the polymerization and intracellular retention of members of the serpin superfamily. The best known is alpha-1 antitrypsin deficiency, with the most common severe deficiency allele being the Z mutation (Glu342Lys). This severe autosomal dominant disorder causes the protein to undergo a conformational transition and form ordered polymers that are retained within hepatocytes. Due to this accumulation of polymers in hepatocytes, blood alpha-1 trypsin levels will decrease leading to chronic uninhibited tissue breakdown. This causes the degradation especially of lung tissue which will eventually lead to pulmonary emphysema. In addition, accumulation of polymers in hepatocytes causes liver diseases such as neonatal hepatitis, cirrhosis, and hepatocellular carcinoma.

Immunogen	Monomeric Z a1-antitrypsin purified from the plasma of a PI*ZZ homozygote (Ref.1)
Aliases	Alpha-1 protease inhibitor, Alpha-1-antiproteinase, Serpin A1
Gene	Gene name: SERPINA1, AAT, PI
References	<ol style="list-style-type: none"> 1. Ordoñez, A et al; A single-chain variable fragment intrabody prevents intracellular polymerization of Z a1-antitrypsin while allowing its antiproteinase activity. The FASEB Journal 2015, 29:2667 2. Storage&stability	Product should be stored at 4°C. Under recommended storage conditions, product is stable for at least one year.
Precautions	For research use only. Not for use in or on humans or animals or for diagnostics. It is the responsibility of the user to comply with all local/state and federal rules in the use of this product. Hycult Biotech is not responsible for any patent infringements that might result from the use or derivation of this product.

We hereby certify that the above-stated information is correct and that this product has been successfully tested by the Quality Control Department. This product was released for sale according to the existing specifications. This document has been produced electronically and is valid without a signature.
