

CERTIFICATE OF ANALYSIS – TECHNICAL DATA SHEET

Product name TNF-RI, Mouse, clone 55R-170

Catalog number	HM1097-500UG		
Lot number	-	Expiry date	-
Volume	-	Amount	500 UG
Formulation	0.2 μm filtered in PBS	Concentration	>0.5 mg/ml
Host Species	Armenian Hamster IgG	Conjugate	None
Endotoxin	<24 EU/mg	Purification	Affinity
Storage	4°C		

Application notes

	IHC-F	IHC-P	IF	FC	FS	IA	IP	w
Reference #				5	1-4,6,7		1	
Yes				•	•	•	•	
No								
N.D.	•	•	•					•

N.D.= Not Determined; IHC = Immuno histochemistry; F = Frozen sections; P = Paraffin sections; IF = Immuno Fluorescence; FC = Flow Cytometry; FS = Functional Studies; IA = Immuno Assays; IP = Immuno Precipitation; W = Western blot

Dilutions to be used depend on detection system applied. It is recommended that users test the reagent and determine their own optimal dilutions. The typical starting working dilution is 1:50.

- FS: The monoclonal antibody 55R-170 is an antagonistic antibody useful for blocking of TNR-RI both *in vitro* and *in vivo*. FS: the 55R-170 antibody is not capable of completely inhibiting the binding of labeled TNF. Theoretically it could be that the lack of endogenous TNF stimulation turns the TNFR1 antagonist HM1097 55R-170, into a partial agonist (Ref. 7) .
- IA: Antibody 55R-170 can be used as a detection antibody.

General Information

Description	The monoclonal antibody 55R-170 recognizes the extracellular part of mouse Tumor Necrosis Factor Resuperfamily member 1A (TNF-RI), also known as CD120a or p55. TNF-RI belongs to the large TNF receptor among which TNF-RII (TNF-R p75-80), lymphotoxin-beta receptor (LTbetaR) and the Herpes virus entry m (HVEM). Ligands for these receptors belong to the Tumor Necrosis Factor (TNF) superfamily of cytokines, activate signaling pathways for cell survival, death, and differentiation that orchestrate the development, organ and homeostasis of lymphoid, mammary, neuronal and ectodermal tissues. TNF-RI contains a characteristic structural cassette termed death domain in its sequence that is conserved w distinct subset of other TNF-R family members, such as CD95, DR3, DR4, and DR5. This death domai characterized as being essential for induction of apoptosis in vitro and has been structurally conserved within TNF-R superfamily members. Deletion of the death domain of the TNF-RI results in a non-functional receptor, inc that the death domain is required for the signal transduction of the physiological functions of TNF-RI in vivo. TNF-RI is a 55 kD type I transmembrane protein and is expressed on a variety of cell types at low levels. It is const to play a prominent role in cell stimulation by TNF-alpha. Induction of cytotoxicity and other functions are mulargely via TNF-RI is present as soluble form in body fluids (for instance plasma and CSF). This extra TNF-RI is generated by two mechanisms, namely proteolytic cleavage of TNF-RI both interact with the hom forms of LTbeta or TNF. However, TNF-RI functions as the high affinity receptor for soluble TNF (sTNF). TNF been shown to be involved in a wide variety of inflammatory diseases, among which heurodegenerative di (Parkinson's and Alzheimer's disease), multiple sclerosis, asthma, atherosclerosis, rheumatology. The monoclonal antibody 55R-170 also recognizes the soluble receptor.					
Immunogen	Purified soluble extracellular domain of mouse TNF-RI.					
Aliases	TNFR type I, CD120a, TNF-RI, TNF-R55, TNFRp55, p55-R, TNF receptor alpha chain					
Gene	Gene name: Tnfrsf1a, Tnfr-1, Tnfr1
