Dilutions to be used depend on detection system applied. It is recommended that users test the reagent and determine their own optimal dilutions. The typical starting working dilution is 1:10.

■ IHC-F: For selection of the most useful dilution in a given situation a test staining with cells or tissue known to express the antigen should be performed. To this end a small fresh skin biopsy can be incubated for 4 hours with TNF-alpha (1 ng/ml), IL-1 (100 U/ml) or LPS (1 µg/ml) in tissue culture medium at 37°C.

## **General Information**
